

I know it might sound a little bit sci-fi, but could you imagine if we could harness the power of a solar storm as it sweeps past our small planet? if we could capture that energy, we could supply our energy--

One of the things that I'd like to learn about the sun is that will it ever blow up or die?--

I can teach magnetism, spectra, systems, cycles, all different things using the sun. Really gets kids--

--a very important aspect of because as we become more and more technologically advanced, our satellite systems--

The cool thing about sunspots is some are cooler than the surface of the sun, and some are even bigger than the whole Earth, which is really cool.
